EDUCATION

Indiana University Bloomington, IN, USA

2023-2028(*Expected*)

Ph.D. student in Computer Science, Advisor: XiaoFeng Wang

Nankai University, Tianjin, China

2019-2023

B.Eng. in Information Security

RESEARCH INTERESTS

Computer security & privacy; System security; Formal verification & PL; Privacy-enhancing technologies

ACADEMIC EXPERIENCE

Center for Distributed Confidential Computing (CDCC)

Aug. 2023 -

Research Assistant Advised by Prof. XiaoFeng Wang

Indiana University Bloomington

The Center for Distributed Confidential Computing (CDCC) is an academic project aiming to lay the technical foundations for scalable data-in-use protection on cloud and edge systems. It is a multi-institution project sponsored by the Secure and Trustworthy Cyberspace Frontiers Program of the National Science Foundation.

- Using Coq to verify security-critical systems and large-scale code.
- Designing cutting-edge hardware-assisted (e.g., CPU and GPU TEEs) technologies for data protection.
- Optimizing and accelerating secure systems for better runtime performance.

Proof of Being Forgotten: Rust-SGX based Enclave Verification Framework

May 2022 - Jun. 2023

Research Assistant Advised by: Prof. XiaoFeng Wang & Dr. Mingshen Sun

Remote

Our goal is to offer an off-the-shelf solution for providing users that the enclave application is verified by Proof of Being Forgotten (PoBF). It refers to a regulation enforcing that code dealing with secrets is verified so that secrets are completely consumed, and no secret is leaked to any unauthorized party.

- Implementing algorithms and allocators for cleaning secret residues in Intel SGX with Rust.
- Implementing type state transfer for secrets in the enclave.
- Learning Coq to verify the execution model formally.

Encrypted Database

Sept. 2020 - Jan. 2023

Research Assistant Advised by: Prof. Zheli Liu

Nankai University

Our goal is to construct a fully encrypted database that allows for efficient queries on ciphertext while providing strong security guarantees.

- Proposed novel encryption schemes for encrypted databases and implemented them in CryptDB.
- Collaborating with Huawei Inc. in making theoretical models practical and viable in real-world applications.
- Leveraging secure enclaves to reduce the overhead and improve the performance of encrypted databases.
- Learning and implementing differential privacy techniques to anonymize the user's sensitive data.

INDUSTRIAL EXPERIENCE

Privacy Innovation Lab, TikTok Inc.

Research Intern Mentored by Dr. Mingshen Sun

May 2024 - Aug. 2024

San Jose, CA

We collaborated on applying Trusted Execution Environments (TEEs) to enhance secure computing environments for businesses:

- Designed and implemented the reproducibility feature for the research tasks that can be conducted on TikTok's Research Platform backed by Google Cloud's TEE instances.
- Proposed a new paradigm called TAVERNS for remote attestation that explicitly excludes the trust to centralized verification services while enjoying the benefits of centralized services.
- Proposed a new solution for verifying the implementation of TEE design based on Zero-Knowledge Proofs and applied for a U.S. patent.

Google Summer of Code: Apache Teaclave (incubating)

Open Source Contributor

Jun. 2023 - Nov. 2023

Remote

Developed state-of-the-art data analysis solutions for privacy policy enforcement using TEEs

Worked on formal verification of the framework to increase trustworthiness and confidence in usage

PUBLICATIONS

- **Haobin Chen**, Yue Yang, and Siyi Lv. Revisiting frequency-smoothing encryption: new security definitions and efficient construction. *Cybersecurity*(7), 15 (2024).

This is the thesis for my bachelor's degree.

- Hongbo Chen, **Haobin Hiroki Chen**, Mingshen Sun, Kang Li, Zhaofeng Chen, XiaoFeng Wang. A Verified Confidential Computing as a Service Framework for Privacy Preservation. In *Proceedings of the 32nd USENIX Security Symposium (Sec'23)*, August, 2023.

SERVICES

- **Committee Member:** ACM CCS 2024 AE, USENIX Security 2025 AE
- **Reviewer:** IEEE TIFS, Peerj Computer Science

SKILLS

| | |
|------------------------------|--|
| Typesetting Document | Latex, Markdown |
| Programming | Rust (Proficient), C/C++ (Proficient), Python, Java |
| FP & Verification | Coq (Proficient), OCaml and Racket (Intermediate), Haskell |

HONORS AND AWARDS

2024 **ACM CCS 2024 Distinguished Artifact Reviewer**

2023 **The 3rd Prize and Regional Outstanding Award at the National Contest for OS Design and Implementation** (as mentor for the team, < 2%)

2023 **Nankai Distinguished Bachelor Thesis Award** (< 3%)

2022 **Nankai Outstanding Innovation Project** (Awarded to undergraduate students who participated in outstanding research projects. < 15%)

2022, 2021 **Nankai Academically Excellent Student Scholarship** (Awarded to undergraduate students with excellent academic performance, < 5%)

- 2022, 2021 **Nankai Innovation Award of Technology and Research Scholarship** (Awarded to undergraduate students with outstanding research potential, < 3%)
- 2021 The 3rd prize at the **National College Student Information Security Contest**, Shandong University (Highest undergraduate contest for information security, < 8%)
- 2021 **Nankai Excellent Community Immersion Project** (< 10%)

TALKS

- 1 **Introduction to Zerocoin: An Anonymous and ZKP-Based E-Cash from Bitcoin**
Presented at course CSSE0014 *Security Protocols and Their Design*
- 2 **How Does the Compiler Work: A Brief Introduction to the LLVM Framework**
Presented at course COSC0017 *Compilers Design*
- 3 **Introduction to the Encrypted Databases**
Presented at course UPEC0990 *Database and Its Applications*
- 4 **The Linux Kernel Fuzzing**
Presented at course CSSE0004 *Software Security*

PROJECTS

- 1 FH-CryptDB (with ~ 6,000 lines of C++ code).
Link: https://github.com/hiroki-chen/FH_cryptDB
- 2 SSE-SEAL: An implementation of the paper *Demertzis et al. SEAL: Attack Mitigation for Encrypted Databases via Adjustable Leakage* (with ~ 3,000 lines of C++ code).
Link: <https://github.com/hiroki-chen/SSE-SEAL>
- 3 SO₂: A recursive doubly oblivious RAM bootstrapping on SGX. (with ~ 4,000 lines of C++ code).
Link: <https://github.com/hiroki-chen/SGXOram>
- 4 Inference attacks against encrypted databases.
Link: <https://github.com/hiroki-chen/FrequencyAttack>
- 5 A compiler for SysY (a C-like language).
Link: <https://github.com/hiroki-chen/NKUCompiler>
- 6 Oblivious-RAM: Reference Implementation for Different ORAM algorithms.
Link: <https://github.com/hiroki-chen/Oblivious-RAM>
- 7 NeoOS: An Unix-Like Kernel in Rust.
Link: <https://github.com/hiroki-chen/NeoOS>
- 8 Proof of Being Forgotten.
